

1. code-88 (You are given two integer arrays `nums1` and `nums2`, sorted in non-decreasing order, and two integers `m` and `n`, representing the number of elements in `nums1` and `nums2` respectively.

Merge `nums1` and `nums2` into a single array sorted in non-decreasing order.

The final sorted array should not be returned by the function, but instead be stored inside the array `nums1`. To accommodate this, `nums1` has a length of `m + n`, where the first `m` elements denote the elements that should be merged, and the last `n` elements are set to 0 and should be ignored. `nums2` has a length of `n`.

```
C v Auto
1 void merge(int* nums1, int nums1Size, int m, int* nums2, int nums2Size, int n) {
2     int i = m - 1;
3     int j = n - 1;
4     int k = m + n - 1;
5
6
7     while (i >= 0 && j >= 0) {
8         if (nums1[i] > nums2[j]) {
9             nums1[k--] = nums1[i--];
10        } else {
11            nums1[k--] = nums2[j--];
12        }
13    }
14    while (j >= 0) {
15        nums1[k--] = nums2[j--];
16    }
17 }
18
```

Case 1 Case 2 Case 3

Input

nums1 =
[1,2,3,0,0,0]

m =
3

nums2 =
[2,5,6]

n =
3

Output

[1,2,2,3,5,6]

Expected

[1,2,2,3,5,6]

2. code-344 (Write a function that reverses a string. The input string is given as an array of characters `s`.

You must do this by modifying the input array in-place with $O(1)$ extra memory.

 Problem List   

 Code

C   Auto

```
1 void reverseString(char* s, int sSize) {
2     int left = 0;
3     int right = sSize - 1;
4
5     while (left < right) {
6
7         char temp = s[left];
8         s[left] = s[right];
9         s[right] = temp;
10
11
12         left++;
13         right--;
14     }
15 }
16
```
